

Stone Text

Description: In this tutorial, we'll be creating a text effect that is formed by small stones.

Press **D** to reset your colors to default

Use the **"Type tool"** and create your text color white on black background. Use a fairly large font for best results.

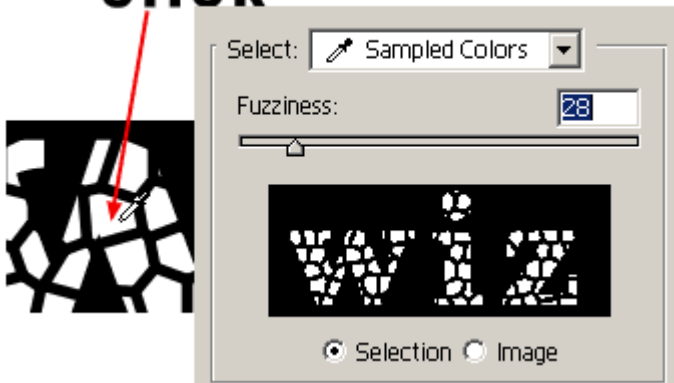

Then go to **Filter->Texturizer->Stained Glass:** (when asked to rasterize, select **"YES"**)
(The following setting may vary depending on the size of your text).

Cell Size:12. **Border Thickness:** 8 **Light Intensity:** 1

Now go to **"Select->Color Range"** and click on the white of the stained glass to select it.

click

Now switch over to the channels pallette, create a new channel, and fill the selection with WHITE.

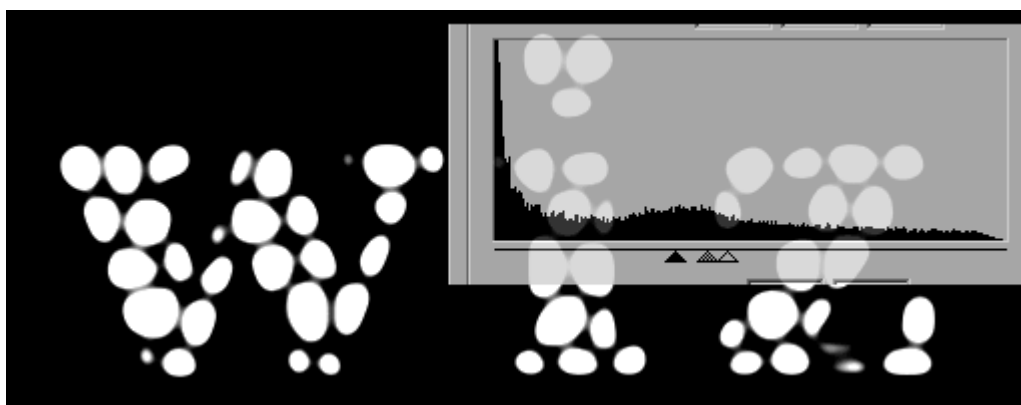

Press **CTRL+D** to deselect.

Now go to **Filter->Blur->Gaussian Blur** Set **Radius: 4.0**

Now go to **Image->Adjustment->Levels**.

Then move the sliders so your image is sharp again.

Now switch back to the layers pallette, you can hide the original text layer because we wont be working with it anymore.

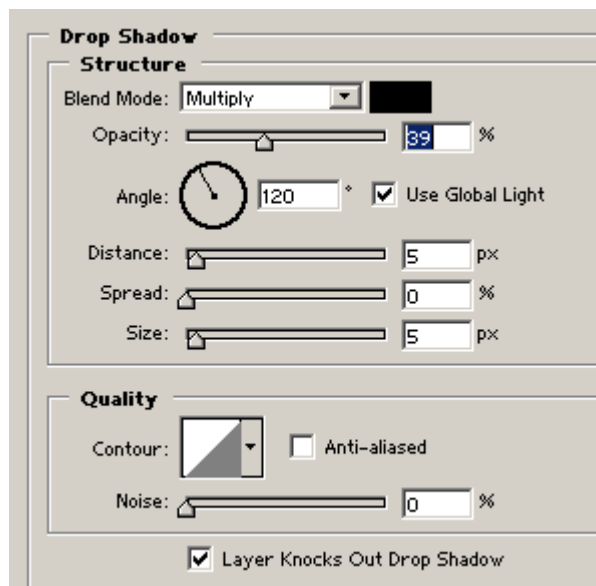

Now to go **Select->Load Selection**. In the **channel** field, select Alpha 1, this will load the select from the channels pallette.

Now create a new layer and fill this selection with grey then DESELECT

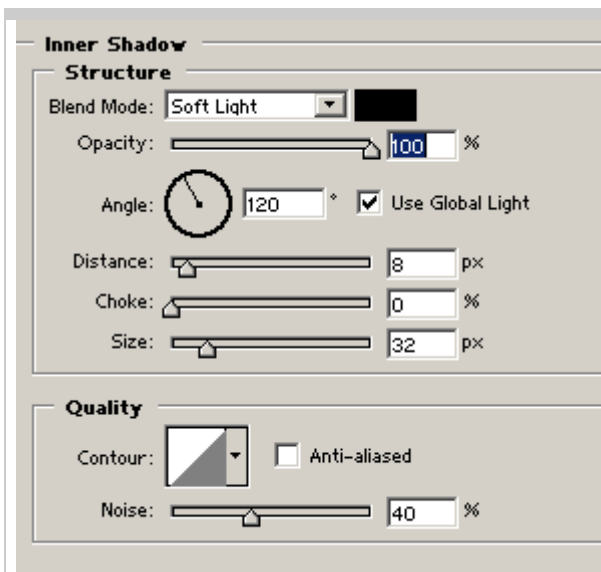

Now apply the following:

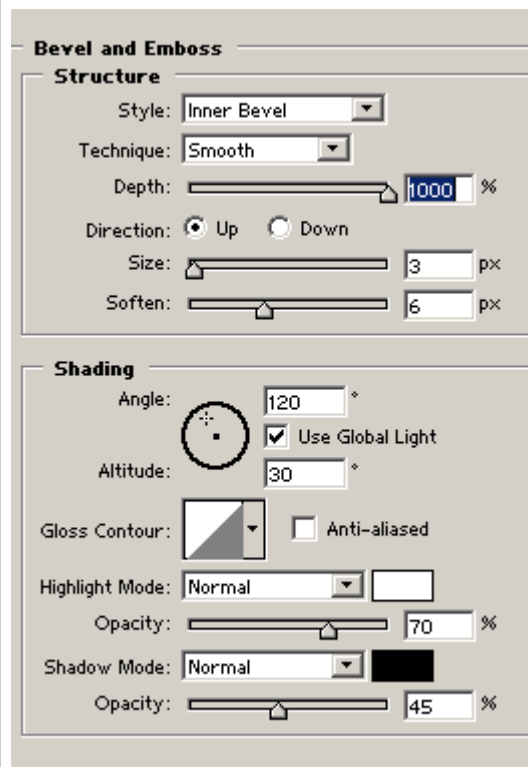

- **Drop Shadow:**

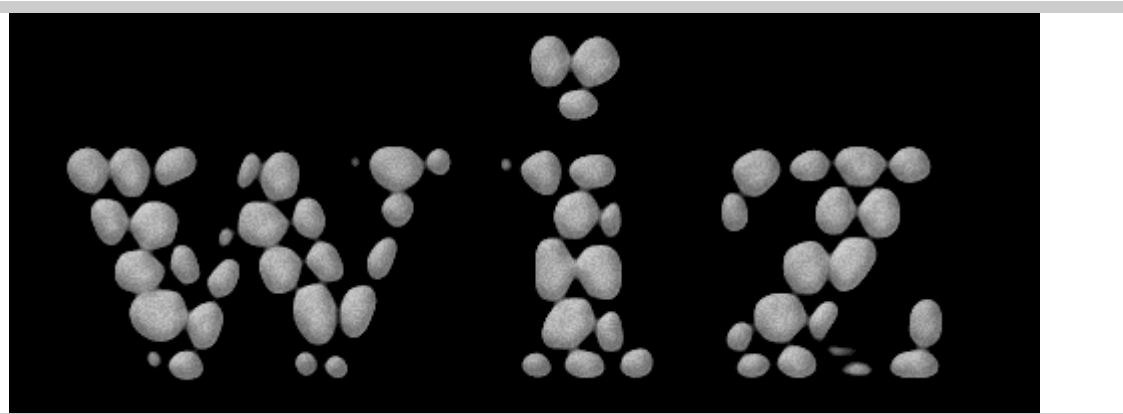

- **Inner Shadow:**

- **Bevel and Emboss:**

- **Color Overlay** - You can set this to grey or any color to your liking.

This looks better on other background other than black, the reason we use black above is because of the way the selections work.
